

Package: dcmodydt (via r-universe)

June 25, 2024

Title Modification Rules on 'data.table'

Version 0.1.0.9000

Description Apply 'dcmodydt' rules on a 'data.table', code generated is optimized for changing a data.table in place / by reference.

dump_dt *Dump data.table modification script*

Description

Dump data.table modification script

Usage

```
dump_dt(x, name = "dat", file = stdout())
```

Arguments

x	dcmofify::modifier() object with the modification rules
name	character name of data.table to be used.
file	where should the generated file be written?

Examples

```
library(dcmofify)

m <- modifier( if (age > 130) age = 130
               , income[age < 12] <- 0
               )

dump_dt(m, "my_data")
```

modify,data.table,modifier-method
Modify records in a data.table

Description

Modify records in a data.table using modification rules specified in a modifier object.

Usage

```
## S4 method for signature 'data.table,modifier'
modify(dat, x, copy = NULL, sequential = TRUE, ...)
```

Arguments

dat	<code>data.table()</code> object
x	dcmofify::modifier object.
copy	if TRUE modify copy of table.
sequential	if TRUE (default), steps will be executed in sequence, so order matters.
...	unused

Details

This is a more efficient implementation than coercing the `data.table` to a `data.frame` and use that implementation.

See Also

Other modify: [setmodify\(\)](#)

Examples

```
library(data.table)

m <- modifier( if (age > 130) age = 130
               , income[age < 12] <- 0
               )

dat <- fread(text =
"age, income
140, 300
11, 2000
25, 3000"
)

# modify a copy of the data
dat_m <- modify(dat, m, copy = TRUE)
print(dat_m)

# the data it self
setmodify(dat, m)
print(dat)
```

setmodify

modifies data.table in place

Description

modifies `data.table` in place, alias for `modify` with `copy=TRUE` and `sequential=TRUE`. It follows the naming convention in `data.table` to prefix methods that change objects (byreference) with `set`.

Usage

```
setmodify(dat, x, ...)
```

Arguments

<code>dat</code>	<code>data.table()</code> object
<code>x</code>	<code>dcmofify::modifier</code> object.
<code>...</code>	not used

Other modify: [modify,data.table,modifier-method](#)

Examples

```
library(data.table)

m <- modifier( if (age > 130) age = 130
               , income[age < 12] <- 0
               )

dat <- fread(text =
"age, income
140, 300
11, 2000
25, 3000"
)

# modify a copy of the data
dat_m <- modify(dat, m, copy = TRUE)
print(dat_m)

# the data it self
setmodify(dat, m)
print(dat)
```
